

PRODUCT DOCUMENTATION

Work About Work

Input / Output Specification

Document type	Product Specification: Calculator and Audit Mode
Version	1.2 (score band banner design finalised; Change 007 updated)
Status	Final
Companion to	Calculator Methodology Sheet v1.1
Audience	Developer (logic) and Designer (interface)
Currency	Euro (EUR / €)

01

Purpose of This Document

This document is the single reference spec for anyone building, modifying, or extending the Work About Work tool. It covers every input, output, and UI component: variable name, type, range, default, display format, plain-English meaning, and implementation notes. A developer or designer should be able to build the entire tool from this document without asking questions.

This spec covers both Calculator mode and the Audit mode score band display. Audit question content and scoring are documented in the Question Bank and Recommendation Logic Map.

02

Architecture Overview

The tool is a stateless, client-side computation. All logic runs in the browser. No backend, no data storage, no authentication. Every output updates in real time as the user moves a slider: there is no submit action.

Layer	Description	Implementation note
Inputs	4 user-controlled sliders	All sliders fire oninput: outputs recalculate on every change, not on release

Constants	2 fixed values baked into the formula	Not exposed in the UI. Do not make configurable without a methodology review.
Computation	8-step formula chain (Step 0 converts hours to %)	Fully documented in Methodology Sheet v1.1, Section 5. All steps are sequential.
Outputs	4 metric cells + 2 visual bars	Display-only. No output value is stored or transmitted.
Audit results	Score band banner + 3 recommendations + CTA	Triggered when all 5 questions are answered. Score determines band. Band determines recommendation set.
Mode switching	Tab toggle between Calculator and Audit	State of calculator inputs is preserved when switching modes and back.

03

Fixed Constants

Two values are fixed and must not be exposed as configurable inputs. Changing either requires a methodology review and a version increment.

Variable	Value	Meaning	Why fixed
weeks_per_year	48	Working weeks per year after leave and public holidays	Conservative standard. Exposing it invites manipulation rather than genuine calibration.
hours_per_week	40	Standard contracted hours per week	Overtime excluded by design to avoid inflating the cost baseline.

04

Input Specifications

Each input is a horizontal range slider. All four are visible simultaneously in the left panel. Label and live value display appear above each slider; min/max labels appear below.

team_size Team size UI: Range slider — integer				
Min	Max	Default	Step	Display format

3	500	25	1	"[value] people" e.g. "25 people"
Plain English		The number of people in the team being assessed. Includes the person completing the tool.		
Range rationale		Min of 3 reflects the smallest meaningful team unit. Max of 500 covers large departments; above this, org-level interventions dominate.		
UI / design notes		Display the live value in magenta to the right of the label. Step of 1, no decimal values.		

avg_salary Average fully-loaded salary UI: Range slider — integer (step 5,000)				
Min	Max	Default	Step	Display format
€30,000	€300,000	€80,000	€5,000	"€[value/1000]K / yr" e.g. "€80K / yr"
Plain English		The average annual cost of one team member to the organisation, including base salary, employer social contributions, pension, and benefits. Not take-home pay.		
Range rationale		Range covers entry-level knowledge workers (€30K) to senior executives (€300K). Step of €5,000 avoids false precision. Default of €80K reflects a mid-market European knowledge worker fully loaded.		
UI / design notes		Display in thousands with K suffix: "€80K / yr" not "€80,000 / yr". Slider only, no free-text input.		

admin_hrs Admin and coordination load (hours per week) UI: Range slider — integer (hours)				
Min	Max	Default	Step	Display format
2 hrs	28 hrs	14 hrs	1 hr	"[value] hrs / week" e.g. "14 hrs / week"
Plain English		The estimated number of hours per week spent on coordination overhead. Converted internally to percentage: $\text{admin_pct} = (\text{admin_hrs} / 40) * 100$.		
Range rationale		Range of 2–28 hrs = 5–70% of a 40-hour week. Default of 14 hrs = 35%, conservative relative to the 16.4-hour benchmark. Hours are more intuitive than percentages.		
UI / design notes		Display as "[value] hrs / week". Admin severity bar: green below 25% converted (less than 10 hrs/week), magenta 25% and above (10 hrs or more). Amber removed.		

adoption_pct		AI workflow adoption rate			UI: Range slider — integer (percentage)
Min	Max	Default	Step	Display format	
0%	100%	50%	1%	"[value]% of team" e.g. "50% of team"	
Plain English		The proportion of the team currently using AI tools consistently for coordination tasks. 0% means no AI in use. 100% means the whole team has consistent AI workflows.			
Range rationale		Full 0–100% range is intentional. 0% produces a reclaim value of €0. Default of 50% reflects early majority adoption.			
UI / design notes		Display as percentage. AI reclaim potential bar is always green. At 0%, reclaim outputs show zero. This is correct behaviour, not a bug.			

05

Output Specifications

All outputs appear in the right panel and update in real time. There are four metric outputs and two visual bar indicators. No output is stored, submitted, or transmitted.

admin_cost		Annual cost of coordination overhead			Ref: Methodology Step 4
Plain English		The total salary cost of time spent on work about work across the entire team per year. The headline number.			
Display location		Headline position: top of right panel, large type.			
Display format		Formatted as €XK or €X.XM. Round to nearest €1K. Never show decimal places on the headline.			
Colour		Magenta (#C4006A): signals cost/problem framing.			
How to interpret		At default inputs: approximately €700K.			

admin_hours		Hours lost per year			Ref: Methodology Step 3
Plain English		Total hours consumed by coordination overhead across the whole team annually.			
Display location		Top-left cell of the 2x2 metric grid, below the headline.			
Display format		Integer with K suffix if >= 1,000. Example: "16.8K".			

Colour	Magenta (#C4006A): cost framing, consistent with headline.
How to interpret	At default inputs: 16.8K hours.

hours_pp_week	Hours per person per week	Ref: Methodology Step 5
Plain English	The individual-level view of coordination overhead: how many hours each person loses weekly on average.	
Display location	Top-right cell of the 2x2 metric grid.	
Display format	One decimal place always. Examples: "14.0", "8.4". Never round to integer.	
Colour	Magenta (#C4006A): cost framing. Updated in Change 002 from body text to magenta for consistent semantic colour logic.	
How to interpret	The benchmark is 16.4 hours (Microsoft/APQC). At default inputs: 14.0.	

reclaim_hours	Hours reclaimable with AI adoption	Ref: Methodology Step 6
Plain English	The hours the team could recover annually with consistent AI adoption at the current rate.	
Display location	Bottom-left cell of the 2x2 metric grid. Bottom two cells have light pink tint (#FFF5FA) background.	
Display format	Integer with K suffix if $\geq 1,000$.	
Colour	Green (#006B2B): opportunity framing.	
How to interpret	At 0% adoption this is always 0. At default inputs: 5.0K.	

reclaim_cost	Value of reclaimed capacity	Ref: Methodology Step 7
Plain English	The monetary value of the hours that could be reclaimed. The ROI numerator.	
Display location	Bottom-right cell of the 2x2 metric grid.	
Display format	Formatted as €XK or €X.XM, rounded to nearest €1K.	
Colour	Green (#006B2B): opportunity framing.	
How to interpret	At default inputs: approximately €210K.	

bar_admin_severity Admin load severity bar		Ref: admin_pct (converted from admin_hrs)
Plain English	Visual indicator of coordination overhead severity. Two colours only.	
Display location	Below the metric grid. Label: "Admin load severity". Value shown as hours per week.	
Display format	Filled bar. Width = (admin_pct / 70) * 100%. Two colours only (Change 003).	
Colour	Green (#006B2B) when admin_pct < 25% (less than 10 hrs/week). Magenta (#C4006A) when admin_pct >= 25%. No amber.	
How to interpret	Green: manageable. Magenta: above threshold where structural intervention is warranted.	

bar_adopt_potential 1 AI reclaim potential bar		Ref: adoption_pct directly
Plain English	Visual indicator of the team's current AI adoption level. Always green.	
Display location	Below the admin severity bar. Label: "AI reclaim potential". Value shown as percentage.	
Display format	Filled bar. Width = adoption_pct%. Always green.	
Colour	Always green (#006B2B). Never changes colour.	
How to interpret	Low bar means high untapped potential. High bar means gains are already being captured.	

06

Layout and Interaction Specification

The following rules govern the overall layout and must be preserved in any reskin or rebuild.

Two-panel layout

Left panel: all four inputs. Right panel: all outputs. Both panels visible simultaneously on desktop. Do not stack vertically on desktop.

Real-time update

Every output updates on every slider movement (oninput). No calculate button. The absence of a submit action is intentional.

Input value display

Current value of each slider displayed to the right of its label in magenta. Updates in real time.

Metric grid

2x2 grid. Top row: cost outputs (magenta). Bottom row: reclaim outputs (green on pink tint background). Visual separation is deliberate and must be preserved.

Mobile behaviour

On screens below 768px: stack panels vertically, inputs above outputs. Output panel should be sticky or scroll-linked.

CTA placement

Text block with styled link at bottom of left panel, pointing to Audit mode. Not a button. Must not compete visually with the sliders.

Mode tab

Calculator / Audit toggle in the header, right-aligned. Active mode: magenta background. Switching mode does not reset slider values.

07

Number Formatting Rules

These rules take precedence over any framework defaults.

Value type	Format rule	Examples
Currency >= €1M	One decimal place + M suffix	€1.2M, €3.7M
Currency >= €1K and < €1M	Round to nearest €1K + K suffix	€560K, €210K
Currency < €1K	Round to nearest integer, no suffix	€840
Hours >= 1,000	One decimal place + K suffix	16.8K, 5.0K
Hours < 1,000	Round to nearest integer	840
Hours per person per week	Always one decimal place, never K suffix	14.0, 8.4
Percentages (display)	Integer only, % symbol	35%, 50%
Admin load (slider label)	"[value] hrs / week"	14 hrs / week
Salary (slider label)	€[value/1000]K / yr	€80K / yr

Audit Mode: Score Band Banner Specification

This section documents the final design of the score band result banner shown in Audit mode after all five questions are answered. This replaces all previous versions of Change 007.

***Core principle:** All three bands share the same background and border. Only the label and title colour changes per band. This creates visual consistency while maintaining clear semantic differentiation.*

Property	All three bands	Healthy	Moderate	High Risk
Background	#FFF5FA (pink tint)	Same	Same	Same
Left border	4px solid #C4006A	Same	Same	Same
Band label text	Uppercase, small, above title	#006B2B	#E8779F	#C4006A
Title text	Georgia serif, large	#006B2B	#E8779F	#C4006A
Score text	#545454 for all bands	Same	Same	Same
Description text	#545454 for all bands	Same	Same	Same

Label and title text per band:

Band	Label text	Title text	Score range shown
Healthy	HEALTHY	Healthy: 0–4	Score: [X] / 15
Moderate	MODERATE	Moderate: 5–9	Score: [X] / 15
High Risk	HIGH RISK	High Risk: 10–15	Score: [X] / 15

The score band legend shown before the audit questions (if present) should use the same colour system: pill labels with the band colour as background and white text.
